CORE SKILLS

- On-chain data analysis
- DuneSQL / Trino SQL
- EVM event decoding
- Dashboard design & data viz
- DeFi protocol analysis
- Data validation & QA
- Smart-contract auditing (fundamentals)
- Technical writing & community

TOOLS & TECH

Dune Analytics · SQL · Python · Herd · Bitquery · Git / GitHub · JavaScript · TypeScript · Next.js · Supabase

FOCUS DOMAINS

Everything DeFi · Lending & credit · Stablecoins · RWA · DEX & LP · Tokenized equities · Fixed-rate markets

PROFILE

On-chain data analyst who turns raw blockchain events into dashboards that show how DeFi protocols actually perform — and where the on-chain reality diverges from the headline. Currently the data analyst for a stablecoin protocol, with shipped analytics across lending, stablecoin, RWA, DEX and tokenized-equity protocols on Ethereum, Base and Circle's Arc. Strong on reproducing protocol metrics from first principles, writing dynamic queries that self-update, and validating every number against ground truth before it ships.

EXPERIENCE

On-Chain Data Analyst & Community Manager — Reservoir Protocol (Agua Vault) — 2025 – Present · Remote

- Data analyst for the team's stablecoin vault product — built end-to-end dashboards: deposit activity, vault **share price**, **APY (7D/30D)**, user net TVL, and liquidity-wallet movement.
- Reverse-engineered the vault's fixed-rate accrual, retained-surplus wedge and instant-redemption fee from **raw on-chain events** to produce accurate, defensible TVL & yield metrics.
- Bridge data and community — translate analytics into clear positioning for the protocol's audience.

On-Chain Data Analyst (Contract) — Tenor Finance — 2026 · Remote · Base

- Built the analytics suite for a **fixed-rate lending** protocol on Morpho Midnight: collateral supplied vs. present, borrow volume, and fixed-rate APR.
- Mapped the credit mechanism to precise metric definitions (principal vs. face, outstanding vs. gross) to avoid common mislabeling.

On-Chain Data Analyst (Contract) — Tenbin Labs — 2026 · Remote · Ethereum

- Delivered a full dashboard for **tokenized FX, gold & commodities**: token supply, holders, protocol fees, staking TVL, share price, APY (7D/30D) and yield-per-offering.

SELECTED RESEARCH & DASHBOARDS

Circle Arc (institutional L1) — first-mover analytics
Among the first to dashboard Circle's Arc at launch: Morpho deposits by vault, on-chain FX volume on Aerodrome (EURC/USDC), and a **Morpho-vs-Aave lending comparison** (supply, borrow, utilization, market share). Reproduced protocol TVL from raw events and validated within ~1% of the protocols' own apps.

Coinbase Tokenized Stocks on Base — Morpho vs. Aave (current)
Cross-protocol comparison of stock-backed USDC lending — dynamically enumerating 120+ tokenized-stock tokens from the issuing factory (zero hardcoding), measuring real supply / borrow / collateral per market, and exposing a capacity-vs-actual-liquidity gap the protocol UIs obscure.

> **How I work:** decode raw EVM events → write dynamic, self-updating SQL → cross-validate against protocol UIs and independent indexers (Herd, Bitquery) before publishing. No hardcoded values; every figure is reproducible and ground-truthed.

BACKGROUND

Smart-contract auditing fundamentals and community management (Reservoir). Also builds full-stack web applications with Next.js, TypeScript and Supabase.
